The school of future

Dear Editor,

I am writing to refute to the claims of report printed on local newspaper. I disagree their claims about the future of school.

The main reason is that schools won't be almost entirely subject to computer in just a few years of time. Since language is one of the most indispensable subjects in school, using computer for studying will decrease the time taken for hand-writing. However, the memories about language knowledge are positively related to time spent on hand-writing. Moreover, it is blatant that most of the schools won't forgo a better method, using traditional textbooks, for students to study language. Therefore, it is doubtless.

Besides, another main reason is that teaching won't mainly be provided by interactive learning software. With the promotion of medical awareness, more and more people know that using computer for too long time will lead to deteriorating in health. For instance, when computer becomes commonplace, the number of people who wear glass rockets. Thus, it is believed that interactive learning software, the complement of computers, won't be accepted by the majority of society.

Thirdly, teachers will not only be assigned to prevent misbehavior. Training a teacher is not just for monitoring and leading a class of student It is also about teaching students through various methods, which can't be replaced by computers. For examples, stubborn students require patient and clever students need advanced technique in learning. How can we type in every teaching method into computer and leave teachers as a movable sentry? Therefore, teachers won't be substituted by computers.

To sum up, I think that traditional teaching method will not be entirely replaced by E-learning but both of them will combine.

Yours faithfully,

Mary
